

LendSight

Business Requirements Document | Credit Risk Analytics Platform

1. Purpose

LendSight provides a structured analytical view of lending portfolio performance, delinquency, exposure, recovery and customer risk. The solution is designed to support management and risk teams with consistent portfolio intelligence and faster investigation.

2. Business Context

The project addresses the need to move from fragmented lending analysis toward a centralized BI view of portfolio health. The analysis covers portfolio KPIs, default risk, PAR, collections, recovery, vintage performance and customer-level risk.

3. Stakeholders

- Credit Risk Analysts
- Risk Managers
- Collections Teams
- Portfolio Managers
- Finance Teams
- Executive Management
- BI/Data Teams

4. Business Objectives

- Monitor portfolio exposure and quality.
- Identify emerging delinquency and severe risk.
- Quantify exposure associated with default.
- Measure collection and recovery performance.
- Compare risk across products, regions and customer segments.
- Evaluate loan cohort performance through vintage/MOB analysis.
- Support customer-level risk investigation and business decisions.

5. Key Risk Metrics

The solution includes Total Loans, Total EAD, Default Rate, Recovery Rate, Collection Effectiveness, PAR, Average DPD, PD, LGD and ECL. The submitted SQL also calculates PAR 30 through PAR 180 and an ECL estimate using $PD \times LGD \times EAD$.

6. Non-Functional Requirements

- Usability: business users should be able to interpret the dashboard without technical assistance.
- Consistency: KPI definitions should remain standardized across reports.
- Performance: visuals and calculations should support practical interactive analysis.
- Maintainability: SQL, Power Query and DAX logic should be documented.
- Scalability: the design should support future production data volumes.
- Security: production deployment should incorporate appropriate access controls and RLS where required.

7. Acceptance Criteria

- Dashboard pages are accessible and logically organized.
- KPIs respond correctly to filters and segmentation.
- DPD and PAR analysis distinguishes delinquency severity.
- Vintage/MOB analysis supports cohort comparison.
- Recovery and collection metrics can be analysed over time.
- Documentation explains business definitions and calculation logic.
- Repository contains dashboard, documentation and analytical code.

9. Scope Note

LendSight is a portfolio analytics project built around simulated lending data. Its outputs demonstrate analytical methodology and BI capability and should not be interpreted as live regulated credit-policy advice.
